

```
MyTrue = 1
    MyFalse = 0
def handle_bool(my_bool):
    if my_bool == MyBoo.MyTrue:
        return "It's my true"
    elif my_bool == MyBoo.MyFalse:
        return "It's my false"
handle_bool(MyBoo.MyTrue)
> "It's my true"
```

handle\_bool(MyBoo.MyFalse)

> "It's my false"

class MyBoo(Enum):

## But what about ...

```
class MyBoo(Enum):
    MyTrue = 1
    MyFalse = 0
def handle_bool(my_bool):
    if my_bool == MyBoo.MyTrue:
        return "It's my true"
    elif my_bool == MyBoo.MyFalse:
        return "It's my false"
handle_bool(MyBoo.MyTrue)
> "It's my true"
handle bool(MyBoo<sub>•</sub>MyFalse)
> "It's my false"
```
