```
foldlInt (::) [] [1,2,3]

-- (::) is called `cons`
(::) : a -> List a -> List a
```

So this takes a function of "cons" or "insert at 0 index"

(insert into the 0 index of a list)

REALKINETIC
YOUR POTENTIAL REALIZED

```
foldlInt (::) [] [1,2,3]

-- (::) is called `cons`
(::) : a -> List a -> List a
```
